                                                                                                                                                                                                  В
                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                 US-09-076-721-24
Sequence 27, Application US/09076721
Patent No. 6379905
GENERAL INFORMATION:
APPLICANT: Fishleigh, Robert V.
APPLICANT: Robson, Barry
APPLICANT: Mee, Roger P.
TITLE OF INVENTION: Fragments of Prion Proteins
NUMBER OF SEQUENCES: 67
                                                                                                                                                                                                                                                                                   Query Match

The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in biological or environmental samples, e.g. for diagnosis, also for removing them from samples, for treating or retarding development of prion-associated diseases, especially Creutzfeldt-Jakob diseases (in latrogenic, new variant, familial resonable, familial insomnia, scrapie, bovine or feline spongiform encephalopathy, transmissible mink or exotic ungulate encephalopathy, or chronic wasting disease. The
measuring human gene expression in a sample derived
                     The invention relates to a single exon nucleic acid

                      By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                      measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                               The present invention relates to single exon
                                                                                                                                                                                            Claim 15;
                                                                                                                                                                                                                                   Single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09-AUG-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 congenital heart disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              odorant receptor DOR59. The odorant genes and proteins, such as those provided by the invention, are useful as they aid in the study of the olfactory organ in mammals, as well as adding the understanding of the link between odour recognition and behaviour in insects. They also enable the identification of compounds capable of activating and inhibiting the receptors, allow the control of pest populations via the use of alarm odour ligands and via the use of ligands which interfere with the interaction between odorant ligands and receptors associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC which modulate expression of these genes, and in methods to identify creeptor binding partners. The Drosophila odorant receptor nucleic acids CC may also be used to identify corresponding genes in other insects, cs such as those which damage crops or transmit disease. The odorant CC receptor proteins may be used to identify agents which modulate their CC activity, to identify binding partners, as antigens to raise antibodies, CC and in methods to modify insect behaviour. The proteins may be also be used in methods of behaviour modification. Such methods may be used CC to study or modify insect behaviour in response to odorants such as CC pheromones. Modification of insect behaviour has a wide range of applications, such as in pest control (e.g., by disrupting the feeding or mating behaviours of pest species), or for enhancing plant CC and/or nucleotides may also be used to identify appetite suppressants, to trap odours of a specific type, as biosensors for the detection of CC explosives, drugs, perfumes or pollutants, and in apiculture to modify the behaviour of bees, for example, to increase the production of royal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAB20901-B20949 represent Drosophila melanogaster odorant receptors. These proteins function as olfactory receptors, and are thought to be members of the G protein-coupled receptor (GPCR) superfamily, which is characterised by the presence of 7 transmembrane helices. Nucleic acids encoding the Drosophila odorant coupled receptor transmembrane helices.

The polypeptides, polynucleotides and CC antibodies raised against the polypeptides are used in a method of CC treatment of a mammal and prevention of disorders caused by the aberrant CC protein expression or activity. The polypeptides can be used as CC molecular weight markers, food supplements, and in antibody production. CC The polypeptides are used to identify compounds which bind to the CC polypeptides. Polynucleotides of the invention are used as probes and CC primers, for sequencing, for chromosome or gene mapping, in the CC production of recombinant proteins, and in generating anti-sense DNA or CC RNA and in gene therapy. Polypeptides of the invention can be used to carget drugs to a tumour, in assays to determine biological activity, to CC target drugs to a tumour, in assays to determine guantitative CC crise antibodies/elicit an immune response, to determine quantitative CC polypeptides of the invention may also be useful in treating platelet CC polypeptides, as tissue markers, and to isolate receptors or ligands. CC disorders, stem cell disorders, regenerating bone, cartilage, tendon, CC ligament and/or nerve tissue, wound healing, treating burns, promoting CC the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, CC Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral crisciples is a contracted to the contracte

            The present sequence represents a novel receptor, CMRF-35-H9, which binds immunoglobulin M (IgM). CMRF-35-H9, a CMRF-35-H9 extracellular domain peptide or a vector encoding these, can be used to modulate an immune response in a patient or to block or inhibit a humoral immune response in a patient of the sequence of the sequence of the patient who has or is about to receive a transplant. The CMRF-35-H9 receptor or extracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding the are useful for identifying modulators. The identified modulators are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transplant. A ligand/antigen construct that binds CMRF-35-H9 can to load a protective antigen or a stimulatory antigen into an ant presenting cell. The level of CMRF-35-H9 in a patient sample can determined to diagnose myeloid leukemia in a patient. An increase of CMRF-35-H9 or decreased level of promyelocytic leukemia is dia of leukemia.
The present sequence represents a novel receptor, CMRR-35-H9, which binds immunoglobulin M (IgM). CMRR-35-H9 a CMRR-35-H9 extracellular domain peptide or a vector encoding these, can be used to modulate an immune response in a patient or to block or inhibit a humoral immune response in a patient. This is particularly useful in a patient who has or is about to receive a transplant. The CMRR-35-H9 receptor or extracellular domain binds to antibodies, which are then no longer free to bind to the

A ligand/antigen construct that binds CMRF-35-H9 can be used to load a protective antigen or a stimulatory antigen into an antigen presenting cell. The level of CMRF-35-H9 in a patient sample can be determined to diagnose myeloid leukemia in a patient. An increased level of CMRF-35-H9 or decreased level of promyelocytic leukemia is diagnostic of leukemia.
                 isolated from hybridomas producing a mouse or rat monocional Ab reacting with the ganglioside GM2 respectively into an expression vector for use in animal cells which contains the human Ab heavy is
                                                             Chimeric human Ab expression vectors are constructed by inserting the Ab heavy and light chain variable region-encoding cDNA
                                                                                                             Disclosure;
                                                                                                                                        Humanised antibody specific for ganglioside GM2 - used for producing a cytocidal effect on cancers such as melanoma, neuroblastoma and glioma.
                                                                                                                                                                                                       WPI; 1994-126857/16.

In contrast to mouse monoclonal Abs, the chimmeric human Abs will not cause anti-mouse Ig Ab prodn. in the patient's body but show a prolonged blood half-life, with a reduced frequency of adverse effects, so that it can be expected to be superior to mouse monoclonal Abs in the efficacy in the treatment of human cancer, for instance.
